

DRYSHIELD

Dental Isolation System

Great dentistry starts with excellent dental isolation. This is easier said than done . . . until now.

The oral cavity presents many challenges to dentists, hygienists and dental assistants. First is the battle with the fighting tongue, tissues from the floor of the mouth, and the cheek. Next is the challenge of saliva from all its active glands and water from the instruments. Finally, there is the task of providing a perfect patient experience throughout all of this.

These never-ending battles are currently solved by simultaneously holding the high-suction tip and hanging the saliva ejector, in addition to unlimited use of cotton rolls, dry angles, gauzes, bite block and mouth mirror. Meanwhile, this is done with a complex flurry of motions. There is also the rubber-dam method, but that can be uncomfortable for patients with all of its additional steps and materials.

Introducing DryShield, an easy-to-use, all-in-one dental isolation system that will forever change how you practice dentistry. DryShield offers a unique, triple-threat combination of controlled isolation, retraction and aspiration of the oral environment, so you can focus on what you do best: providing high-quality dentistry and patient satisfaction. DryShield puts you back in control, allows you to run your schedule more efficiently, and makes dentistry fun again.

DryShield was designed by a practicing dentist who understands the challenges that patients and dentists face. This real-world understanding has led to a product that solves current dental isolation challenges.

DryShield features a U.S.-patented, *autoclavable* mouthpiece. It's made of a soft, flexible silicone material that contours comfortably to a patient's mouth. With simplicity in mind, it is available in four sizes to accommodate every patient, including children.

The DryShield mouthpiece is designed to hold the tongue back while retracting the cheek to improve visibility and provide protection from trauma. The sides of the mouthpiece create a safety seal with the palate and floor of the mouth to protect the airway from particles and debris. DryShield bite blocks are interchangeable, giving the patient a way to rest while providing the dentist the ability to customize all mouth sizes as needed.

The soft, pliable mouthpiece makes it easy to fold, insert and place comfortably for each patient. The DryShield system efficiently removes water, saliva and debris from the mouth to keep it dry, allowing you to do two-quadrant dentistry.

Installing the DryShield is quick and easy. Transport your dental office into the future in seconds. Whether you are an owner of a practice, or an associate who works in multiple offices, DryShield can be permanently installed or used as a portable system.

Stop stressing at the thought of dental isolation. Whether it's cleanings, sealants, fillings, crowns, bridges, implants, or extractions, DryShield isolation will make doing great dentistry a breeze. Whether your patient is a child or an adult, DryShield is easy to use and comfortable for everyone. ■
